

Google Play and App Store Compliance Checklist

Date: 22 May 2026

Application: WordWildWest

This document is an operational checklist for store submission.

Current blocker: the app supports account creation/login but does not yet include an in-app account deletion button. This should be implemented before Google Play and App Store submission.

1. Confirmed project facts

- Account: yes.
- Login: Google, Apple and PlayFab guest login.
- In-app account deletion: not yet.
- AdMob: active.
- Unity LevelPlay: active.
- AppLovin: not confirmed; treat as active only if enabled in final mediation.
- Extra analytics/crash reporting: not confirmed.
- PlayFab: cloud saves and leaderboards.
- Audience: includes children, teenagers and adults.
- Age goal: broadest suitable age range for a word game.

2. Google Play Data Safety

Google requires an accurate Data safety section for each app. It must cover the app's data collection, sharing and security practices, including third-party SDKs, versions, regions and user ages.

WordWildWest will likely need disclosures for account/platform identifiers, email if collected, device identifiers, advertising ID, IP address, technical data, gameplay activity, progress, scores, leaderboards, purchases, entitlements, ad interactions and diagnostics if enabled.

3. Google Play account deletion

Because the app supports account creation, it should provide an in-app way to initiate account deletion. The recommended minimum is Settings > Account > Delete Account, with confirmation, warning about loss of progress/cloud saves/leaderboards/account entitlements, and a PlayFab/backend deletion request.

4. Google Play target audience and Families

Because the target audience includes children, the Play Console target audience section should include child age groups. This triggers Families Policy requirements, including use of Families Self-Certified Ads SDKs when serving ads to children or users of unknown age.

Recommended configuration: non-personalised ads for children and unknown-age users, age-appropriate ad rating, no behavioural tracking for children and confirmation that all child-facing ad SDKs are permitted.

5. Apple App Privacy Labels

App Store Connect requires App Privacy Details describing data types collected, whether linked to users, purposes and tracking. Prepare answers for identifiers, display name/profile, usage data, diagnostics, purchases, coarse location via IP, contact info if email is collected, advertising data and gameplay/account data.

6. Apple ATT and tracking

If the app collects data and shares it with other companies for cross-app/site tracking, or uses IDFA for personalised advertising, it must use App Tracking Transparency before tracking. If the app does not track on iOS, remove IDFA/NSUserTrackingUsageDescription and configure SDKs accordingly.

7. Apple account deletion

Apps that support account creation must let users initiate account deletion within the app. Email-only deletion is not enough for store review.

8. Age rating

Complete store age-rating questionnaires based on the actual content: word game, ads, purchases, online features, leaderboards, login, user-generated content if any and user interaction if any. To keep a broad age range, avoid free chat, unmoderated user content, inappropriate ads, behavioural tracking for children and manipulative purchase pressure.

9. Before submission

- Implement in-app account deletion.
- Confirm final SDKs, including analytics/crash reporting.
- Confirm whether AppLovin is disabled in final mediation.
- Gate EU/UK consent before AdMob, LevelPlay and other non-essential SDKs.
- Configure child handling: non-personalised ads, permitted SDKs, no child behavioural tracking.
- Complete Google Play Data Safety from the real build.
- Complete Apple App Privacy Labels from the real build.
- Validate age rating and target audience.
- Ensure published policies match the app exactly.
